

The Case Reports of Adverse Reactions to HPV Vaccines Ignored by the Government

Dr. Sin Hang Lee presents 13 references on serious adverse reactions after HPV vaccination, either as a full article or as published abstract of a full article, after an incomplete search of the medical literature. Most health care providers who reported these cases are concerned about damage to the central nervous system with papilledema and transient loss of vision being a common finding. A group of physicians in Connecticut, including a neuropathologist who reviewed the brain biopsy of a young girl stated in the report [5]:

We report the case of a 16-year-old girl who suffered an acute and sustained onset of bilateral visual loss and transient left hemiparesis following an immunization against human papilloma virus, who was found to have both a tumefactive demyelinating lesion and chiasmal neuritis as part of a presentation of acute demyelinating encephalomyelitis.
