

## Newsletter 24 The Australian Government's Vaccination Schedule

### has never been tested for Safety

30 May 2013

The Australian Government has not tested the current childhood vaccination schedule for safety. In 2013 the schedule includes 11 vaccines before an infant is 1 year of age and the ingredients in this combined schedule are listed below. Safety of this schedule can only be established with a controlled trial that compares the health outcomes of fully vaccinated children with fully unvaccinated children. *This study has never been done.*

All vaccines cause some neurological adverse events in *some* children. The possible side-effects of vaccines are listed on the vaccine package inserts. The government does not have accurate information on how many children are being damaged by vaccines because it does not have an active post-vaccination surveillance system that monitors the health of all vaccinated children. Therefore it cannot make causal links to the vaccine (TGA).

The government has continued to add vaccines to this schedule for diseases that were a low risk to the majority of children by 1950. High participation rates in vaccination programs are shifting the risk of infectious disease to long-term chronic illness. This results in parents being life-long carers for their children.

Vaccines did not control infectious diseases. Herd immunity due to natural exposure to infectious agents resulted in the reduction in virulence of these diseases and this is described by 20<sup>th</sup> century public health authorities here

In Australia doctors are required through their registration to support government vaccination policy. They are informed by the government that they are to remove 'anti-vaccination' material from their waiting rooms. 'Anti-vaccination' is a label used for the science that demonstrates the risks of vaccines. In all the time I have been presenting this

research (4 years) no medical doctor has written to me with their concerns *and evidence* to refute the information I am providing. I invite all doctors to present their concerns to me so they can be debated unedited on my website. Please supply your names and GP practices so they can be published with your comments.

Here is the list of ingredients in vaccines. I suggest that all parents ask their doctors what is in the vaccines and request the package insert for confirmation of the possible side-effects before you vaccinate your child.

**Aluminium hydroxide, Aluminium hydroxide/phosphate, Aluminium phosphate, Borax, Egg Protein, Formaldehyde, Gelatin, Gentamicin (antibiotic), Kanamycin (antibiotic), Monosodium Glutamate (MSG), Neomycin (Antibiotic), Phenol, Phenoxyethanol, Polymyxin (antibiotic), Thiomersal (mercury compound), Yeast (Aust Government March 2013)**

Funded lobby groups are discrediting researchers and consumers who are presenting this information to the public. This research is being done at the university and I am providing academic information for debate. Your feedback is welcome and will be debated on this website.
