

Newsletter 60 An HPV Tragedy Hidden by the Australian Media

I would like to publicise an Australian case of a serious adverse reaction to the HPV vaccine because the Australian mainstream media is not covering both sides of the vaccination debate. Please read this story written by the parents of an Australian teenager in the prime of her life that has been struck down by the Gardasil vaccine <http://sanevax.org/australia-gardasil-survivor/> It is important that all parents of adolescents - boys and girls - read this description of the possible adverse events from HPV vaccines because the government and medical profession are not informing the public about the very real possibility of serious adverse events after HPV vaccination.

This sad case is replicated many times in Australia and other countries where court action has now been started against the pharmaceutical company and some health authorities – Spain, France and India. All parents of Australian children who are scheduled to receive this vaccine in school programs should take note of the symptoms that are described in this case and observe their child's health for several years to see if their children's health deteriorates after receiving this vaccine. For more information on the possible side-effects of HPV vaccines please visit www.sanevax.org

The reactions after vaccination are not always immediate - they can occur weeks, months or years later because of the known delayed effects of the chemicals in vaccines. Please write to the Health Minister and ask why this vaccine was introduced into the Australian population before it was proven to be safe, effective or necessary?
